Sourcebook (Economic Theory, Econometrics, and Mathematical Economics):

The literature on international economics has become excessively specialized. In selecting distinguished readings for this source book--including contributions by Nobel laureates such as Lawrence R. Klein, Arthur Lewis, James Meade, and Theodore W. Schultz--Professor Letiche breaks the mold. The essays concentrate on interrelation between theory and actual policy design, and this collection of classic pieces and recent economic contributions are a valued resource in universities and government offices.

"Contains contributions by many internationally known economists, and the level of the texts selected is...to be commended.... The book has the virtue of providing a broad spectrum of viewpoints.... Creates a distinctly positive impression. It accomplishes its aim of demonstrating the basic principles of actual current international economic policies and is a valuable contribution for those seeking orientation in this extensive field."--INTERNATIONAL SOCIAL SCIENCE REVIEW
